THE UNIVERSAL FORCE OF TIME · MEDICINE

HIV and AIDS

A forged address the body cannot read — four routes by which a foreign address corrupts the immune register, and the four corrections that aim at the address itself

Stephen Daubney · The Daubney Foundation · 2026 · Rev 6 (supersedes Rev 5: the disease given in full as medicine knows it; the cures, the door-deletion, the reservoir, prevention and gene editing credited; off-lattice values stated without a foreign number; the virus's key protein corrected to on-lattice; the CCR5-Δ32 frequency corrected)

Tau (T) is the living fabric of time itself — the sole substance of which all physical reality is composed. It is generated by the Sun, as by every star for its own system, and flows outward in the form of the DNA double helix, creating matter, which it deposits at nodal points — the planets — and creating life. Every particle, force, wavelength and conscious experience is a structured configuration of T-flow. The conservation law $d\Sigma T = 0$ governs all change: T is never created or destroyed at a node, only redistributed.

THE IMMUNE REGISTER, NUMBER FIRST

healthy CD4 **500–1500** ($2^2 \cdot 5^3$ – $2^2 \cdot 3 \cdot 5^3$) · AIDS below **200** ($2^3 \cdot 5^2$) · collapse below **50** ($2 \cdot 5^2$)

the key **gp120** ($2^3 \cdot 3 \cdot 5$) · the door-deletion **Δ32** (2^5) · nine genes (3^2)

the forged address: **9,749** letters — cannot be written in twos, threes and fives

ABSTRACT

For forty years HIV has been the virus medicine could hold but never evict. Treatment silences it so completely that a person with an undetectable virus lives a near-normal life and cannot pass it on; yet stop the treatment and the virus returns within weeks. Only a handful of people have ever been cured, each by replacing the whole immune system. Medicine's own numbers have been in the clinic all along: a healthy CD4 count runs from **500** [$2^2 \cdot 5^3$] to **1500** [$2^2 \cdot 3 \cdot 5^3$] cells per microlitre; AIDS is declared below **200** [$2^3 \cdot 5^2$]; the viral genome is **9,749** letters long.

This paper reads HIV and AIDS in the Universal Force of Time, in full. **Part I sets out the disease as medicine knows it** — the CD4 cell, the two-key door, the provirus written into the genome, the reservoir, the count and the collapse — and what the research has found: people born without the second key are resistant (the CCR5-Δ32 discoveries, 1996); **the virus has been cured** by transplants from such donors (Berlin, 2009; London, 2019; and since); a suppressed virus is not transmitted (the PARTNER study, 2019); a twice-yearly injection prevented every infection in its trial (PURPOSE 1, 2024); and gene editing has cut the provirus out of infected animals (2019). **Part II reads it in the theory.** The immune system is the body's proof-reader, and the CD4 cell is its coordinator. The virus's key, **gp120**, sits on the lattice [$2^3 \cdot 3 \cdot 5$] — it is admitted because it carries the keys the door reads. But the address it writes, **9,749** letters, cannot be written in twos, threes and fives, and it is written in reverse into the record the cell uses to know itself. The reader has no slot to file it; that is why the body never clears it.

Part III reads the disease as four routes — the door is opened, the forged address is written, the rewrite goes permanent, the coordinator collapses — each paired with its correction: close the door, excise the address, replace the archive or silence it for good, reach it before the wall. One law binds them: **aim at the address, not its voice, and do it before the reader is overrun.** Fifteen propositions, P-HIV-1 to P-HIV-15, are stated. The research groups are credited by name; the corrective detail is held in the Foundation's clinical reference. The structure resolves into the clinical trial.

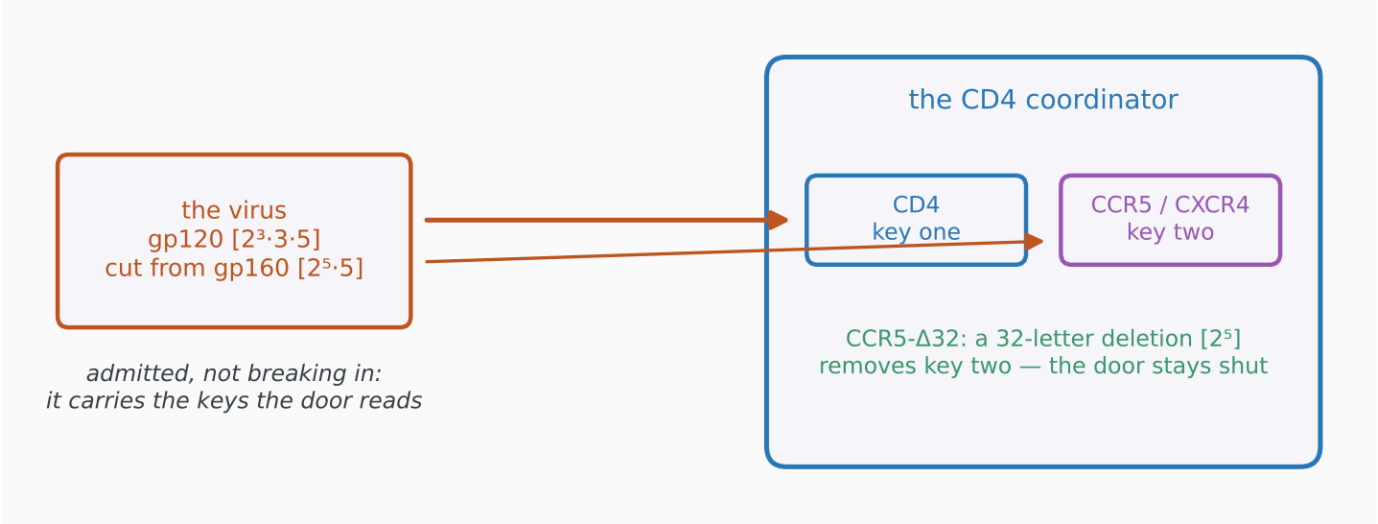

Figure 1 — The entry door is a two-key lock on the CD4 coordinator's own surface. The virus's key protein, gp120 [$2^3 \cdot 3 \cdot 5$], cut from gp160 [$2^5 \cdot 5$], sits on the lattice: it is admitted, not breaking in. Remove the second key — the 32-letter CCR5-Δ32 deletion [2^5] — and the door stays shut.

THE TERMS THIS PAPER USES

T, the substance. Tau (T) is the living fabric of time itself, the one substance of which everything is made. It is generated by the Sun and flows outward as the DNA double helix, creating matter and creating life. Everything a body does — a heartbeat, a breath, the holding of its warmth — is T moving in a structured way.

An address. Every value in this framework is a product of powers of 2, 3, 5 and π, and nothing else. That product is the value's address, and the set of all such products is the lattice. A number that needs any other prime is not on the lattice.

Number first. Every value is written with its number first, as a reader meets it, and its address in brackets behind it. The number is what is there; the address is how it is built.

The free decade. Moving a value by a power of ten costs nothing on the lattice, because ten is two times five: the move shifts twos and fives together and changes nothing else. That is why 24 millimetres and 0.024 metres are one address.

The π-degree. The degree of an address is the power of π it carries, and the degree says what kind of thing the value is. An even degree is a **room** — a state, a thing that sits; it pairs, like a pair of circles. An odd degree is a **road** — a transport, a thing that carries; it is the unpaired circle. A half degree is a **door** — a source, which squares to a whole address.

The day, 864. The day is 86,400 seconds [$2^7 \cdot 3^3 \cdot 5^2$], written 864 at its decade. It is the ground state of the DNA helix and the gear through which a per-second value becomes a per-day value.

The time ladder. A rate given per second is carried up the clocks by fixed steps: × 60 to the minute, × 60 to the hour, × 24 to the day. The amount is the same; only the choice of clock changes — the same quantity counted in seconds or counted in days. From the day the orbit is completed one of two ways — × 360 gives the year as a degree value, × 2π gives the year as a radian value. The two answers are two faces of one year, and both are read.

The two gears. Two numbers carry energy between the theory's registers and appear throughout the record. **10,368** [$2^7 \cdot 3^4$] carries an energy in electron-volts to kilojoules per mole. **31,104** [$2^7 \cdot 3^5$] carries an energy in electron-volts to a circumference. When a quantity of the body lands on one of them, it is speaking in the theory's own units.

The veil. The veil is 180/π = 57.29577951308232, the number that turns radians into degrees. In the Universal Force of Time a wavelength in nanometres is an angle in degrees directly; multiply it by π/180 — cross the veil — and the bare value it carries appears.

The register. A register is a level at which T is read. Each organ of the body is a register — a receiver tuned to one face of the time-field — and each cell, molecule and rhythm within it holds an address on that register.

The six faults. A register can fail six ways. It can be **missed** — its target still exists but it has settled at the wrong place; **demoted** — dropped to a lower order while its parts survive; **frozen** — locked at one address and unable to move; **contaminated** — carrying a foreign address; **misdirected** — its own proof-reader turned against it; or **eroded** — its nodes deleted. Under dΣT = 0 the field redistributes to the nodes that survive; it does not rebuild an address that has gone.

The conversion grammar. One value takes several forms, and fixed steps move it between them: a frequency divided by 2π is a free fall; a free fall times 49.5035535 [7776/(50π)] is a wavelength; a wavelength times π²/8 is a mass. Run in one line, frequency to mass is a single step of 9.72, and every π cancels.

Free fall. In the Universal Force of Time there is no gravity, and a free fall is not a pull. It is the flow of time at a place, in metres per second, every second — time showing itself in one more form, which current science takes for a gravitational fall. A planet makes one turn; where the turn comes in at less than 24 hours, time makes up the difference with a flow at that place, height or depth, so that the turn and the flow together make 24 hours. For the Earth, the free fall on the celestial register, **9.818362093946918** [$5^{12}/(2^7 \cdot 3^9 \cdot \pi^2)$], times 2400 — the 24-hour day, carried two decades — is the Earth's sidereal rotation, **23,564.06902547260** [$5^{14}/(2^2 \cdot 3^8 \cdot \pi^2)$]: 23 hours, 56 minutes and 4 seconds on the clock.

The three registers, G0, G1 and G2. The record reads the same value at more than one level: G1, the surface register of the Earth; G2, the celestial register; G0, the register below. A value and its neighbour one register up — one level up — stand one **G-bond step** apart, 1.000090150603356 [$5^{10}/(2^4 \cdot 3^9 \cdot \pi^3)$].

The 612 step. A second fixed step, 1.000612842467911 [$2^9 \cdot 3^5 \cdot \pi/5^8$] — helium's weight divided by four (helium divided by four, per nucleon), and 36,864 × 864 × π read at its decade. Where a family of lines stands G1, G2 and then one step further, the further step is this one.

The helical turn. The helical turn, 1.004693930041152 [$5^6/(2^6 \cdot 3^5)$], is the step by which the DNA helix climbs one turn — one revolution of the helix. A value carried "one helical turn up" is multiplied by it.

What a landing is worth. Multiply or divide two lattice numbers and the answer is always on the lattice; that much is guaranteed and is not evidence. What counts is a result that lands on a **named object** the theory had already fixed — the day, body temperature, the heartbeat, the day — at a bare power of ten. Each such landing in this paper is marked as arithmetic or as a landing, in its own sentence.

PART I — HIV AND AIDS AS MEDICINE KNOWS IT

1. The virus and the cell it chooses

HIV, the human immunodeficiency virus, infects the **CD4 helper T cell** — the cell that coordinates the immune response, calling in the killer cells, directing the antibody-makers and holding the memory of what the body has met. The virus is a **retrovirus**: it carries its genes as RNA, copies them into DNA with its own enzyme, reverse transcriptase, and writes that DNA permanently into the chromosome of the cell it infects, where it is called the **provirus**. Its genome, first sequenced in full in 1985, is **9,749** letters long and carries **nine** genes.

2. The two-key door

To enter, the virus's surface protein **gp120** — cut, with its partner **gp41**, from a larger precursor, gp160 — clasps the **CD4** receptor that marks the helper cell. That is not enough: the virus must also grip a second receptor, **CCR5** or **CXCR4**, and only then does its envelope fuse with the cell. In 1996 two groups found that people carrying a 32-letter deletion in the CCR5 gene, **CCR5-Δ32**, make no working CCR5. About one in ten people of Northern European descent carry one copy; about one in a hundred carry two, and those are resistant to the common strains of the virus.

3. The reservoir

Antiretroviral therapy stops the virus copying itself. But in 1997 Diana Finzi, Robert Siliciano and colleagues found that resting memory CD4 cells keep the provirus silent and intact even after years of therapy — the **latent reservoir**. It is untouched by the drugs, because the drugs act on a virus that is copying, and a silent provirus is not. Stop the therapy and the reservoir wakes, and the virus returns within weeks.

4. The count and the collapse

The clinic follows the disease by the **CD4 count**. A healthy count runs from about **500 to 1500** cells per microlitre of blood. Untreated, HIV destroys CD4 cells over years; **AIDS**, the acquired immunodeficiency syndrome, is declared when the count falls **below 200**, or when one of the defining illnesses appears; below **50** the body is open to almost every opportunistic infection. Those illnesses — Pneumocystis pneumonia, cytomegalovirus, toxoplasma, cryptococcus, the mycobacteria, Kaposi sarcoma — are mostly organisms and cells held quietly in check in a healthy body. A count of **350** was long the line at which treatment was started.

5. What treatment achieves

Modern antiretroviral therapy suppresses the virus so thoroughly that it becomes undetectable in the blood. The count recovers, the opportunistic illnesses clear, and life expectancy approaches normal. And an undetectable virus is not transmitted: **undetectable equals untransmittable**.

6. What the research has found

These are the results as the research groups reported them; the credit for each is theirs.

The door can be closed. Michel Samson, Marc Parmentier and colleagues, and Rong Liu, Nathaniel Landau and colleagues, found in 1996 that two copies of CCR5-Δ32 protect against infection by the common strains (*Nature*; *Cell*).

The virus has been cured. Gero Hütter and colleagues gave a man with HIV and leukaemia — the Berlin patient — a stem-cell transplant from a donor with two copies of CCR5-Δ32, and the virus never returned when therapy was stopped (*New England Journal of Medicine*, 2009). Ravindra Gupta and colleagues reported a second such remission — the London patient (*Nature*, 2019) — and further cases have followed, in Düsseldorf (Björn Jensen and colleagues, *Nature Medicine*, 2023) and in a woman treated with cord blood in New York (Jingmei Hsu and colleagues, *Cell*, 2023). Each was treated for a blood cancer; each had the whole immune lineage replaced.

A suppressed virus is not passed on. In the PARTNER study, Alison Rodger and colleagues followed gay couples in which one partner had HIV suppressed by therapy, through tens of thousands of acts of condomless sex, and found **no** transmissions from the partner with HIV (*The Lancet*, 2019).

The door shut by injection. In the PURPOSE 1 trial, **lenacapavir**, an injection given **twice a year**, prevented every HIV infection among more than two thousand women who received it (Linda-Gail Bekker and colleagues, *New England Journal of Medicine*, 2024).

The address cut out. Prasanta Dash, Kamel Khalili, Howard Gendelman and colleagues combined long-acting therapy with gene editing that cuts the provirus out of the genome, and eliminated HIV from a subset of infected humanised mice (*Nature Communications*, 2019). Gene-editing approaches of this kind have since entered first human trials.

That is HIV and AIDS as medicine knows it, given in full because what follows reads every part.

PART II — HIV AND AIDS IN THE UNIVERSAL FORCE OF TIME

7. The proof-reader and its coordinator

In the Universal Force of Time the immune system is not chiefly a chemistry of antibodies but a **reading apparatus**: the body's proof-reader. Every cell it meets, it checks against a T-address — the coordinate in the time-field that says *this belongs to you*. The CD4 helper cell is its **surveillance coordinator**: it does not kill the intruder itself; it reads the field and tells the rest of the immune system what it has found. HIV does not break the proof-reader with force. It slips a forged address into the records, written in a code the proof-reader cannot parse — and it slips it, with terrible precision, into the one cell whose whole task is to read.

8. The key sits on the lattice

The door the virus enters is a two-key lock on the coordinator's own surface: the receptor that names the cell as coordinator, and a second key beside it. The virus does not break in. **It is admitted, because it carries the keys the door was built to read.** And the theory finds the key itself on the lattice: **gp120** [$2^3 \cdot 3 \cdot 5$], cut from **gp160** [$2^5 \cdot 5$]. The part of the virus that touches the door speaks the door's own language. Its fusion partner, **gp41**, cannot

be written in twos, threes and fives — the part that forces the membranes together is the part off the lattice. And the deletion that keeps the door shut is **32** letters long [2^5]: one clean lattice cut removes the second key, and the virus can clasp the first all it likes and never enter.

9. The forged address

HIV writes itself into the genome. In the theory that is the insertion of a foreign T-address into the address space of the CD4 cell. The viral genome is **9,749** letters long, and **9,749 cannot be written in twos, threes and fives** — it is not a lattice address at all. Its **nine** genes [3^2] ride inside an address that is, as a whole, irreducibly foreign. The immune system reads the world in {2,3,5,π}; handed an address off the lattice, it has no slot to file it under. **The forgery is not a clever fake of a real address — it is a number the filing system cannot represent.** That is why the body never clears it on its own.

And the word *reverse* is the deepest part of the diagnosis. The theory classes HIV as a **Class IV reverse-polarity corruption**: the provirus is a Strand-2 instruction written against the handedness of the host helix — the first Strand-2 biological entity identified in the framework. A counter-rotating instruction written into the very address space the cell uses to know itself does not sit there to be read past; it corrupts what it touches.

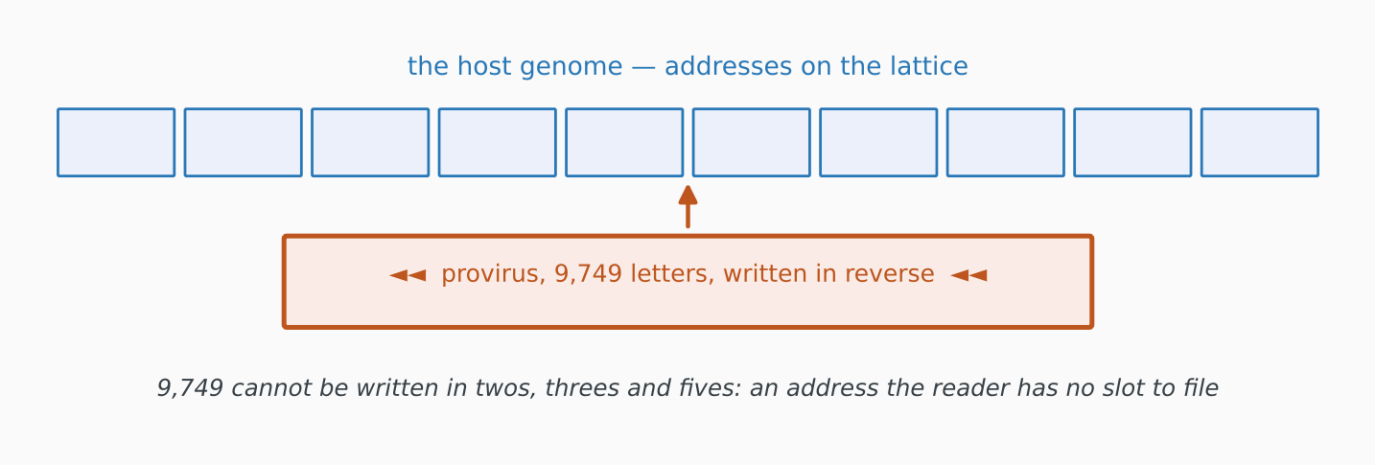

Figure 2 — The provirus is written into the host's address space against the helix's handedness, and its length, 9,749 letters, cannot be written in twos, threes and fives: an address the reader has no slot to file.

10. The permanent rewrite

Once the provirus is written, the forged address stops being a visitor and becomes a permanent edit to the host's record; every division copies it to the daughter cells. The latent reservoir is that rewrite at rest: a corrupted node holding the reverse instruction without voicing it. Antiretroviral therapy stops the address from being copied and read aloud — it silences the **voice** — but it never deletes the **address**. That is the precise reason four decades of suppression have never produced a cure: suppression was never aimed at the address, only at its expression. **A held line is not a won war.**

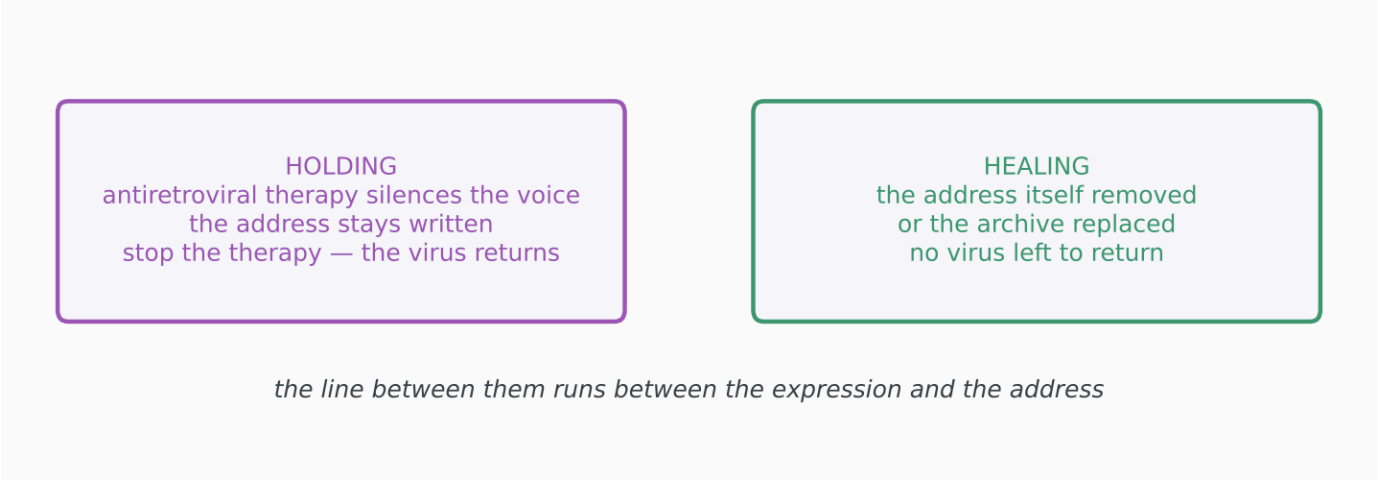

Figure 3 — Holding and healing. Suppression silences the voice and leaves the address written, so the virus returns when the therapy stops. Healing removes the address, or replaces the archive that holds it.

11. The count is a coherence meter

The CD4 count that every clinic tracks is, in the theory, a **coherence meter** — a reading of how much of the immune register still rings true. Its lines are lattice nodes: the healthy band from **500** [$2^2 \cdot 5^3$] to **1500** [$2^2 \cdot 3 \cdot 5^3$]; AIDS below **200** [$2^3 \cdot 5^2$]; collapse below **50** [$2 \cdot 5^2$]. A register can absorb a scattering of corrupted nodes and still proof-read; past a point the readable lattice is so interleaved with the unreadable forgery that coherence fails. The old treatment line in the falling band, **350**, is the one clinical line that cannot be written in twos, threes and fives: the band where the register is losing its hold, read by a number that is itself off the lattice. **AIDS is not HIV.** HIV is the forgery; AIDS is what happens to a body once the cell that reads every other address has fallen below the line — the body does not meet new enemies, it loses its grip on the ones it was already holding.

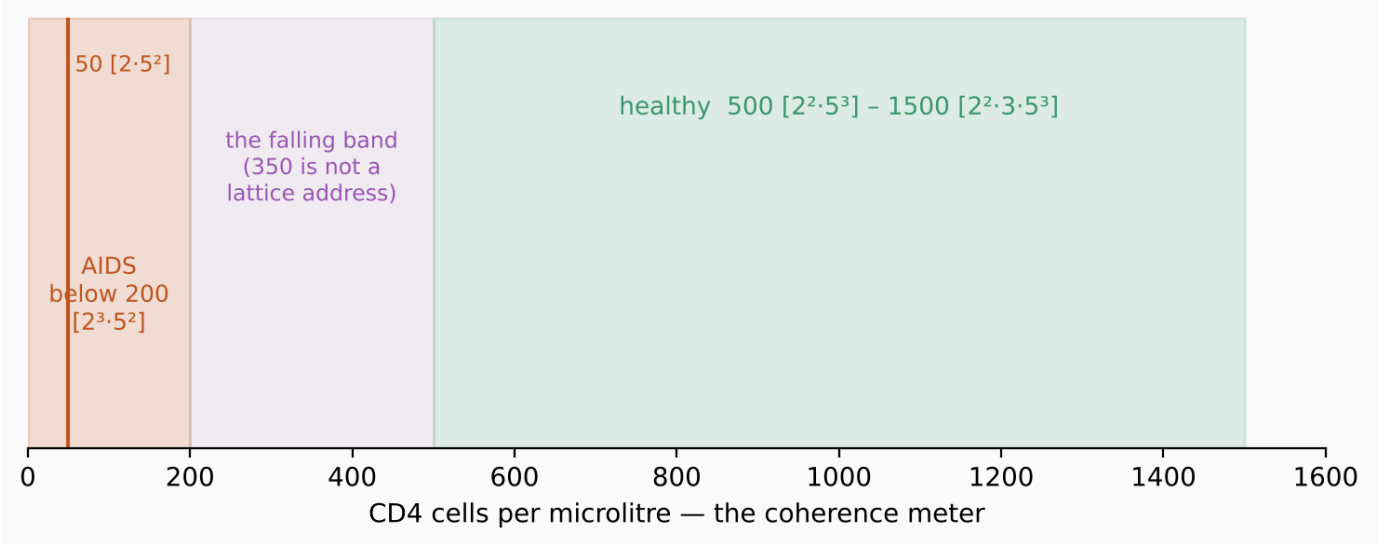

Figure 4 — The CD4 count as a coherence meter: the healthy band from 500 [$2^2 \cdot 5^3$] to 1500 [$2^2 \cdot 3 \cdot 5^3$]; AIDS below 200 [$2^3 \cdot 5^2$]; collapse below 50 [$2 \cdot 5^2$]. The falling band's old treatment line, 350, is not a lattice address.

12. The cures read

The cured patients read directly in the theory. Each received a transplant whose conditioning destroyed the whole contaminated immune lineage, and rebuilt it from donor cells without the second key. **The corrupted records were not silenced but erased, and rewritten clean, on a lattice the forgery has no door into.** The proof of concept is not pending; it has happened more than once. And the prevention results read the same way from the other side: a door shut by injection twice a year, **6** months apart [2·3], let no virus in.

13. One pen, three diseases

The body writes its addresses onto DNA with a chemical marking system — **methylation is the pen** — and permanent silencing turns that pen on the forged address, to bury it in a silence it cannot wake from. Name the pen, and three of the Foundation's papers describe one machine used three ways: in autism the pen writes the identity map differently from the outset; in cancer it fails to maintain the identity a cell was given; in HIV it is turned on a forged address to silence it. **One machine, three diseases.**

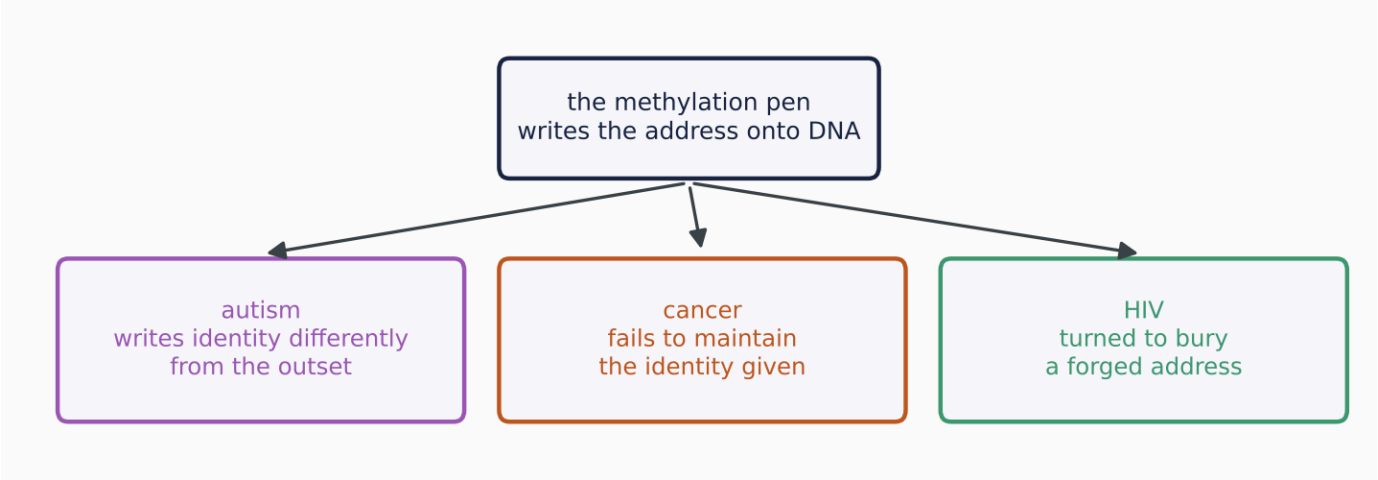

Figure 5 — One pen, three diseases: the methylation system that writes the address onto DNA writes identity differently in autism, fails to maintain it in cancer, and can be turned to bury a forged address in HIV.

14. Where these results come from

The research is theirs. The door-deletion is Michel Samson and Marc Parmentier's and Rong Liu and Nathaniel Landau's groups'; the reservoir is Diana Finzi and Robert Siliciano's; the cures are Gero Hütter's, Ravindra Gupta's, Björn Jensen's and Jingmei Hsu's groups', and their patients'; the untransmittable virus is the PARTNER investigators' (Alison Rodger and colleagues); the twice-yearly prevention is the PURPOSE 1 investigators' (Linda-Gail Bekker and colleagues); the excision is Kamel Khalili and Howard Gendelman's groups'. It was their results that pointed this paper to these parts of the problem, and their work is the supporting evidence on which these sections are built. What this paper adds is the theory's reading — the door's key on the lattice and the address off it; the count's lines as lattice nodes; holding against healing — offered to those groups, and to any team so minded, to test.

PART III — FOUR ROUTES, FOUR CORRECTIONS

15. Four faces of one process

A medical paper of the Universal Force of Time acknowledges the illness, reads the problem as the distinct routes by which it arises, and pairs each route with the correction that would set it right. HIV has four, and they are four real faces of one process: a door that is opened, a forged address written off the lattice, a rewrite that becomes permanent and copies itself, and a coordinator that finally collapses. A person with untreated HIV is travelling all four at once. And every correction, unlike lifelong suppression, is aimed at the address rather than at its voice.

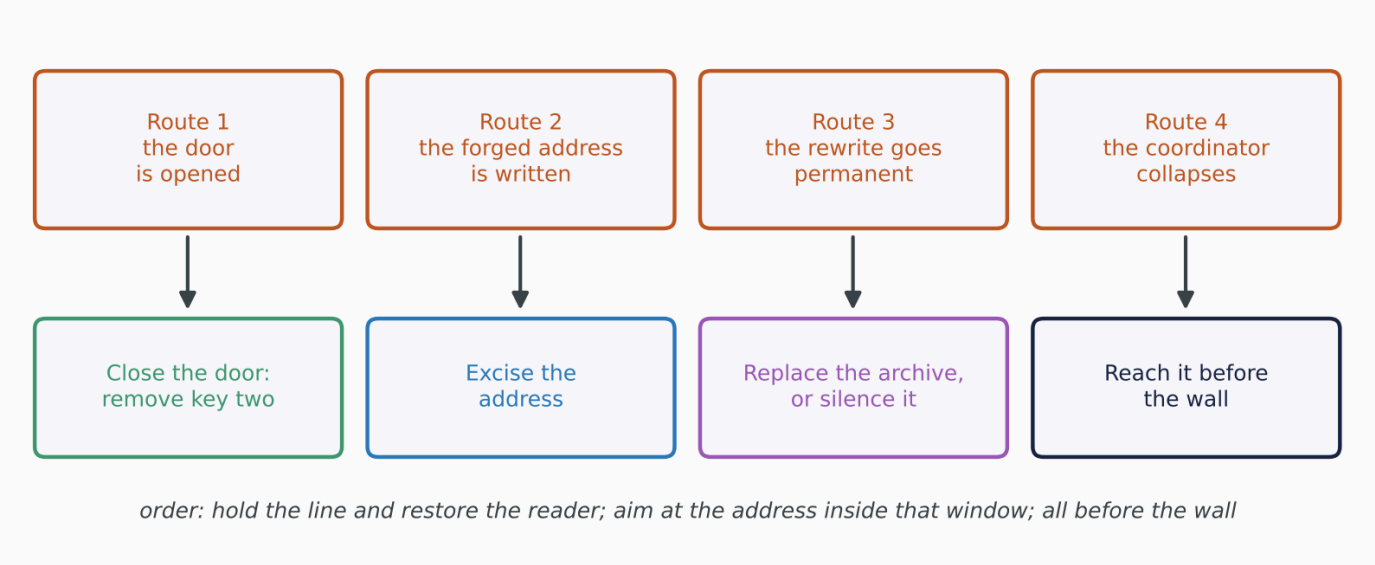

Figure 6 — The four routes and their corrections, bound by the order law: hold the line and restore the reader; aim at the address inside that window; and all of it before the wall.

16. Route 1 — the door is opened

The coordinator advertises the very keys the virus has evolved to grasp, and the virus is admitted.

Correction 1 — close the door. If the virus is admitted through a two-key lock, the correction is to take away a key. A fraction of humanity proves the principle by birth: with the second key missing, the common virus can clasp the first and never enter. And the door can be shut from outside as well, as the twice-yearly injection has shown. The principle is door-closing; the detail is held in the Foundation's clinical reference.

17. Route 2 — the forged address is written

The provirus is written off the lattice, in reverse, into the record the cell uses to know itself.

Correction 2 — excise the address, and let the host's repair restore the lattice. If the disease is a foreign address written into the host's record, the most direct correction is to cut it out. A precision editor reads to the chosen address, cuts there, and lets the cell's own repair close the gap; its guide is **20** letters [$2^2 \cdot 5$], a clean lattice query. Excise the foreign address and the lattice is restored. Where suppression silences the forgery, excision removes it — and because the fault is an address rather than a swarm of free virus, removing the address reaches even the reservoir that suppression cannot touch. The principle is excision; the detail is held in the Foundation's clinical reference.

18. Route 3 — the rewrite goes permanent

Every division copies the forgery, and the reservoir holds it at rest, beyond the reach of drugs that act only on a copying virus.

Correction 3 — replace the archive, or silence it for good. If the rewrite is permanent and self-copying, the correction must either remove the archive or seal it shut. **Replace the archive:** rebuild the immune lineage from cells the virus cannot enter — the road that has already cured people, and that becomes scalable when the resistant cells are the patient's own. **Or silence it for good:** turn the body's own methylation pen on the forged address, to bury it where it cannot wake. The principle is replacement or permanent silencing; the detail is held in the Foundation's clinical reference.

19. Route 4 — the coordinator collapses

The count falls through the healthy band, past the line at 200, and the proof-reader loses its grip on everything it was holding.

Correction 4 — reach it before the wall, and restore the reader. The collapse is the wall, and the correction is timing. Because AIDS is the consequence of the collapse and not the contamination itself, it is largely reversible: restore the coordinator, and the opportunistic illnesses clear and the count recovers. This is the one thing suppression does superbly — it buys the window. The only damage that does not heal is to the nodes that do not

regenerate, lost in long untreated collapse: the same irreversibility law that governs every node the body cannot rebuild. The principle is to act inside the reversible window; the detail is held in the Foundation's clinical reference.

20. The order law

The four corrections are not interchangeable. **Aim at the address, and do it before the reader is overrun.** Corrections 1 to 3 — close the door, excise the address, replace or silence the archive — act on the forged address itself, the thing suppression never touches; and they must be brought to bear while the coordinator still works, because correction 4 is the clock. So the sequence the theory insists on is: hold the line and restore the reader; inside that window, close the door and excise or seal the address; and finish before the wall.

21. Readings off the lattice

The disease is not the register climbing onto some special number. The 9,749 letters of the viral address, the fusion protein's mass, the treatment line at 350 — values that cannot be written in twos, threes and fives — are the signature of something that does not belong on the lattice, or of a register being overwhelmed. They are never destinations. **The correction is therefore never to push the register toward any number, but to remove the foreign address and let the lattice re-form.**

22. The resolution — the clinical trial is the next step

We have acknowledged the illness — the virus medicine could hold but never evict. We have read it as a forgery: a key on the lattice that opens the coordinator's door, and an address off it, written in reverse into the record the cell uses to know itself; a count whose lines are lattice nodes, falling to the line where the register is overrun — and that collapse, not the virus, is AIDS. We have named four routes and given for each its correction, bound by one law. The position is plain: **HIV is not incurable. It is unsolved only at the scale of everyone** — an engineering and delivery problem, not a biological mystery, with the proof already standing in the cured.

The corrections are stated as principles precisely because the next step is not to prescribe them to a reader but to put them to a clinical trial — to decide whether closing the door suffices, whether the address must be excised, whether the archive must be replaced or can be silenced, and in what order.

PROPOSITIONS

- **P-HIV-1.** The immune system is the body's proof-reader; the CD4 helper cell is its surveillance coordinator.
- **P-HIV-2.** The entry door is a two-key lock on the coordinator's own surface; the virus is admitted, not breaking in.
- **P-HIV-3.** The virus's key, gp120 [$2^3 \cdot 3 \cdot 5$], cut from gp160 [$2^5 \cdot 5$], sits on the lattice; its fusion partner gp41 does not.
- **P-HIV-4.** The door-deletion CCR5-Δ32 is 32 letters [2^5]; two copies keep the common virus out.
- **P-HIV-5.** The viral address, 9,749 letters, cannot be written in twos, threes and fives: a number the filing system cannot represent; its nine genes [3^2] ride inside it.
- **P-HIV-6.** HIV is a Class IV reverse-polarity corruption: a Strand-2 instruction written against the host helix.
- **P-HIV-7.** The reservoir is the rewrite at rest; suppression silences the voice and never deletes the address.
- **P-HIV-8.** The CD4 count is a coherence meter on lattice lines: 500 [$2^2 \cdot 5^3$] to 1500 [$2^2 \cdot 3 \cdot 5^3$]; AIDS below 200 [$2^3 \cdot 5^2$]; collapse below 50 [$2 \cdot 5^2$]; the old line at 350 is not a lattice address.
- **P-HIV-9.** AIDS is not HIV but its consequence: the coordinator below the line, and the body's grip on what it was holding lost.
- **P-HIV-10.** HIV has been cured by archive replacement — the contaminated lineage erased and rebuilt from cells without the second key.
- **P-HIV-11.** One pen, three diseases: methylation writes identity differently in autism, fails to maintain it in cancer, and can silence a forged address in HIV.
- **P-HIV-12.** Routes 1 and 2: the door is opened; the address is written. Corrections: close the door; excise the address (guide 20 letters [$2^2 \cdot 5$]).
- **P-HIV-13.** Routes 3 and 4: the rewrite goes permanent; the coordinator collapses. Corrections: replace the archive or silence it; reach it before the wall.
- **P-HIV-14.** Order law: hold the line and restore the reader; aim at the address inside that window; all before the wall.

- **P-HIV-15.** HIV is not incurable; it is unsolved only at the scale of everyone.

APPENDIX — EVERY NUMBER, REBUILT

Every value can be rebuilt with any calculator, from twos, threes, fives and π. The script H_calc.py asserts every station; it passed in full.

```
THE REGISTER, NUMBER FIRST
   healthy CD4 band              500 ; 1500 cells/uL          2^2.5^3 ; 2^2.3.5^3
   AIDS line ; collapse          200 ; 50                     2^3.5^2 ; 2.5^2
   old treatment line            350                          not a lattice address
   the key ; its precursor       gp120 ; gp160                2^3.3.5 ; 2^5.5
   the fusion partner            gp41                         not a lattice address
   the door-deletion             32 letters                   2^5
   the viral address ; genes     9,749 letters ; 9            not a lattice address ; 3^2
   the editor's guide            20 letters                   2^2.5
   prevention interval           6 months                     2.3
```

A NOTE ON THE NUMBERS

Throughout this paper a value is given first as the plain physical reading a clinician or laboratory would make — a count, a length in letters, a mass — and only then, in brackets, as its place on the {2,3,5,π} lattice. The bracket is the address; the physical number is the thing you can hold. Where a value is off the lattice, the paper says that it

cannot be written in twos, threes and fives, and no more. The corrections are stated as principles; the corrective detail is held in the Foundation's clinical reference and is not prescribed here.

The Daubney Foundation is in ongoing discussions with medical establishments regarding clinical trials of Universal Force of Time solutions to the conditions described in this paper. Any institution or researcher wishing to put themselves forward for participation in these trials is invited to make themselves known through: thedaubneyfoundation@gmail.com
